## Class Diagram:

---

# Specifications

## 1. Vending Machine

### 1.1 checkAlerts

- Check if the storage of product is lower than 5 and update alerts

- Check if the storage of the coins(1, 0.5) is lower than their threshold and update alerts
- Check if the storage of the bills(5, 10, etc.) is lower than their threshold and update alerts
- Check if the storage of the money is greater than their threshold and update alerts

## 1.2 add\_to\_cart

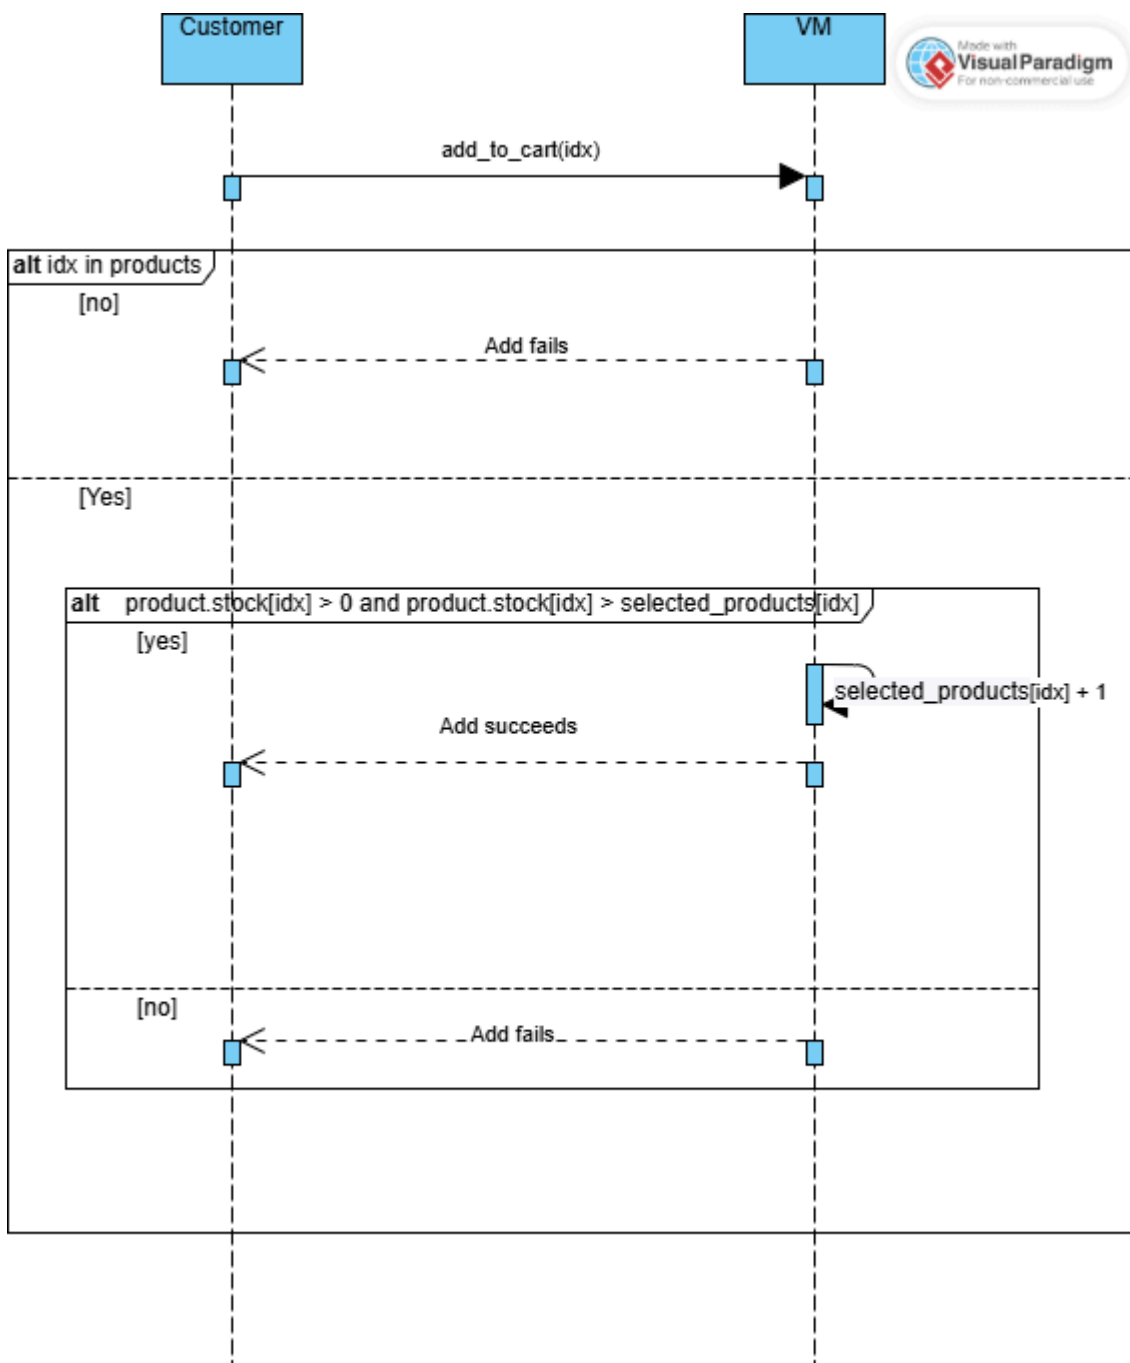

- Check if the index of product exists in product lists.

If not, report action failure.

- Check if the stock of the product is greater than 0 and if the stock is still greater than the amount that has already be chosen.

If so, add the product into the cart and return success.

- return failure.

## 1.3 remove\_from\_cart

- Check if the index of product exists in product lists.

If not, report action failure.

- Check if the product has been selected

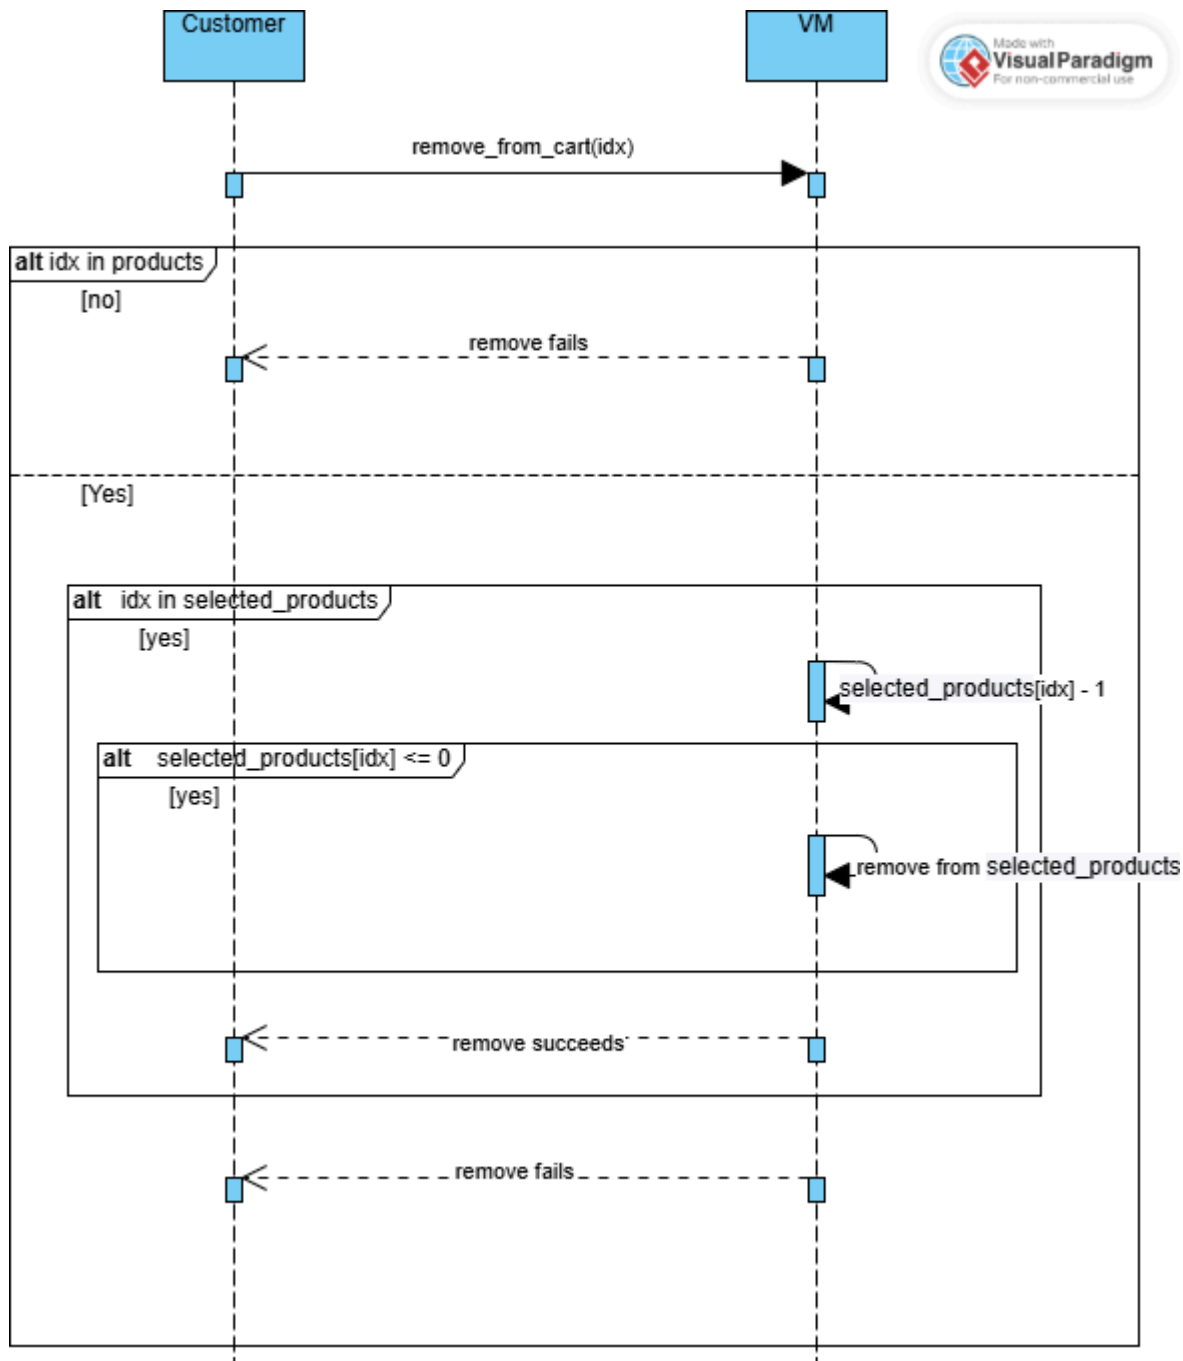

If so, decrease the selected number.

- Check if the selected number is decreased to 0

If so, remove the selected product.

return removal success.

- return failure.

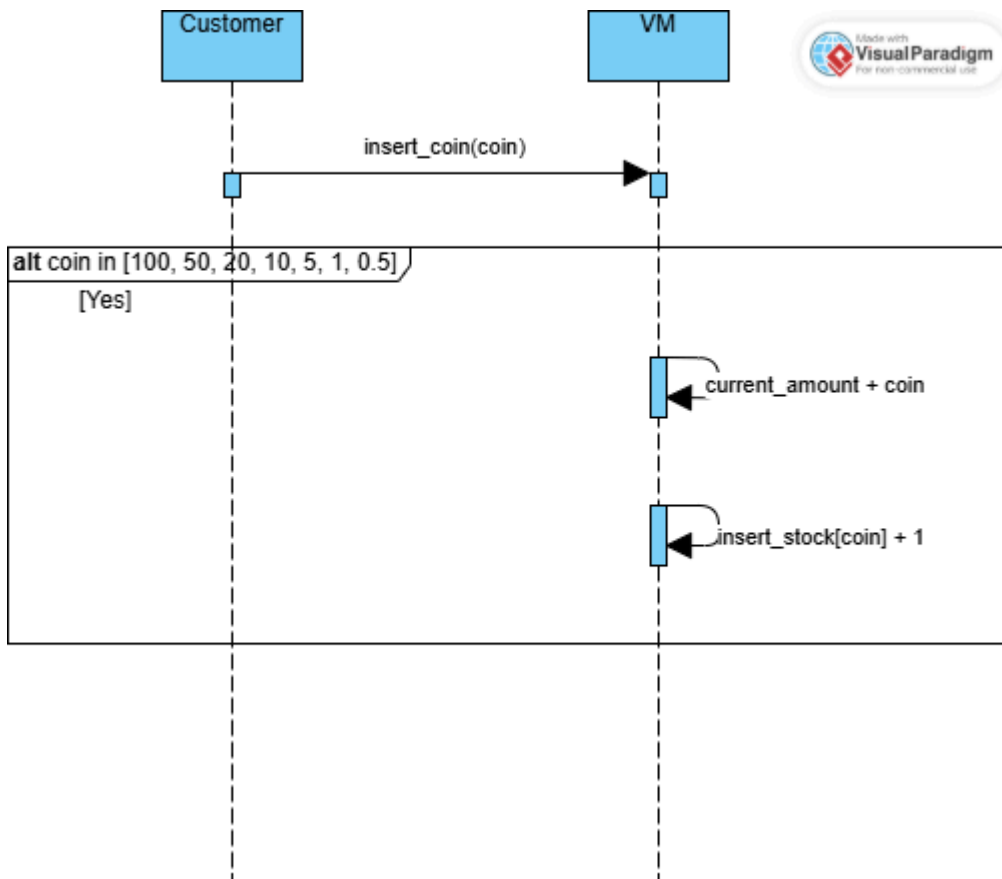

## 1.4 insert\_coin

- Check if the coin is valid

if so :

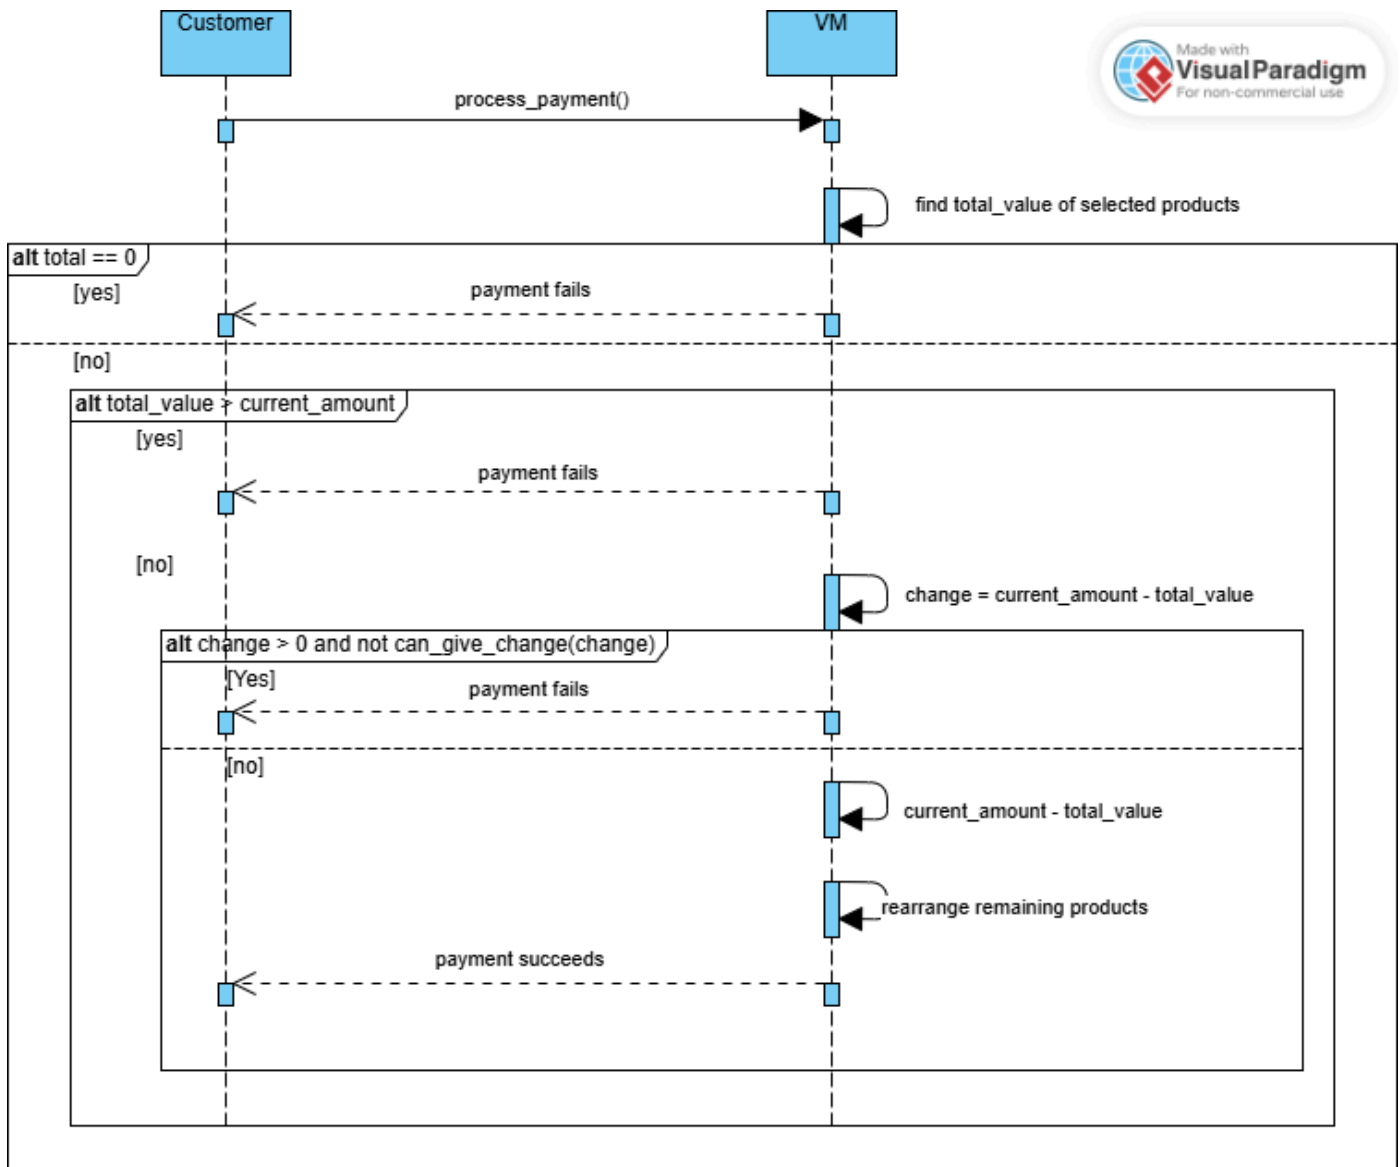

Add the value of coin into total value

Increase the number of the coin inserted by 1

## 1.5 process\_payment

- Get total value of selected products.
- If the value is 0  
return payment failure
- If the value is greater than inserted amount,  
return payment failure
- $\text{change} = \text{inserted amount} - \text{total value}$
- If  $\text{change} > 0$  and cannot give change  
return payment failure
- Current\_amount subtracts total value
- Rearrange the remaining products.
- return payment success

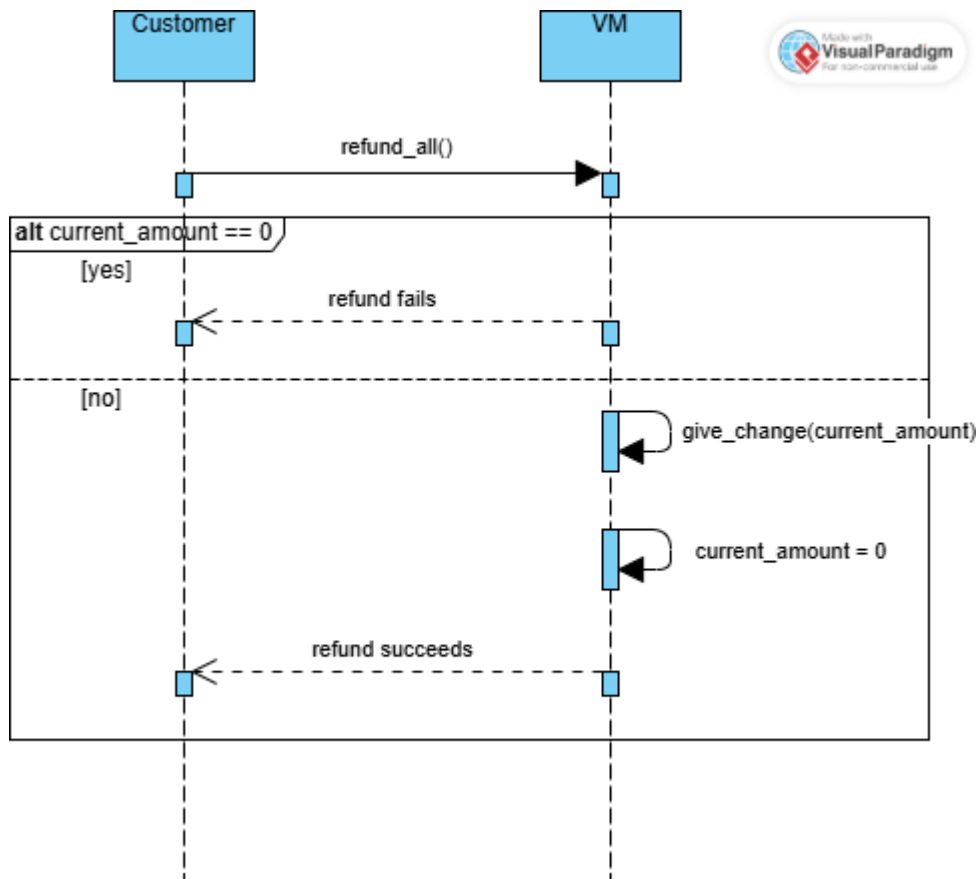

## 1.6 refund\_all

- Check if `current_amount` is 0

If so, return failure.

- Apply `give_change`
- set `current_amount` to 0
- return success

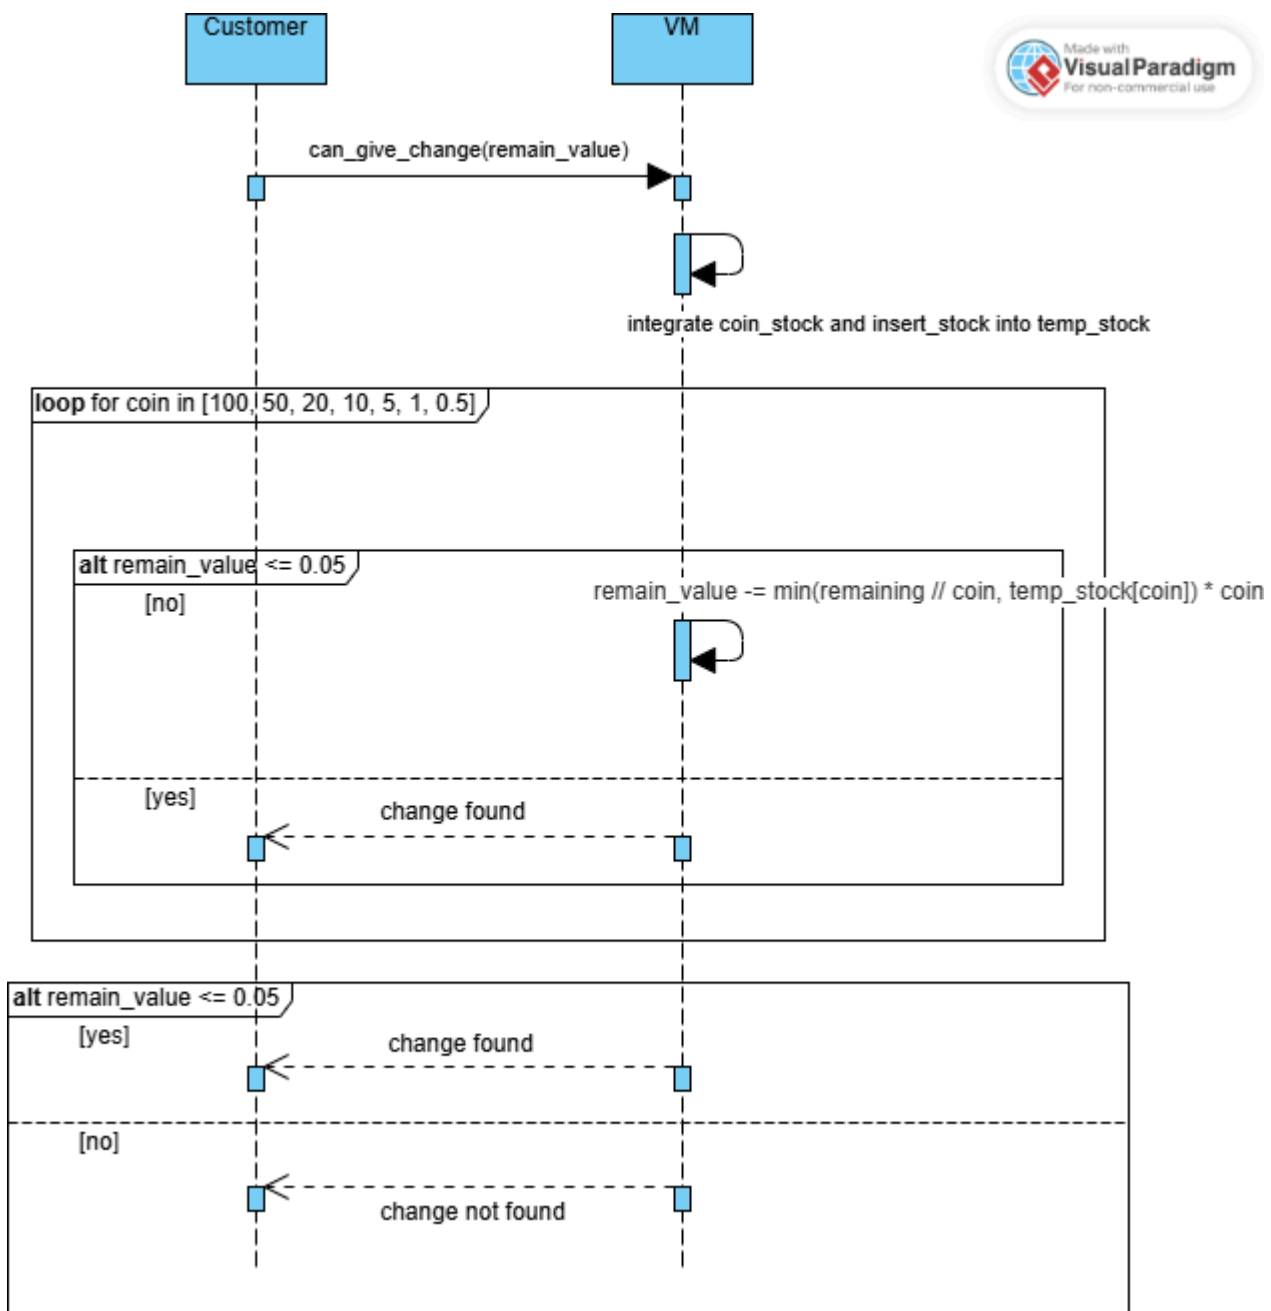

## 1.7 can\_give\_change

- Integrate `coin_stock` and `insert_stock`
- For every possible value that coins can represent, subtracts the maximum value within range of `[0, remain_value]` it can provide

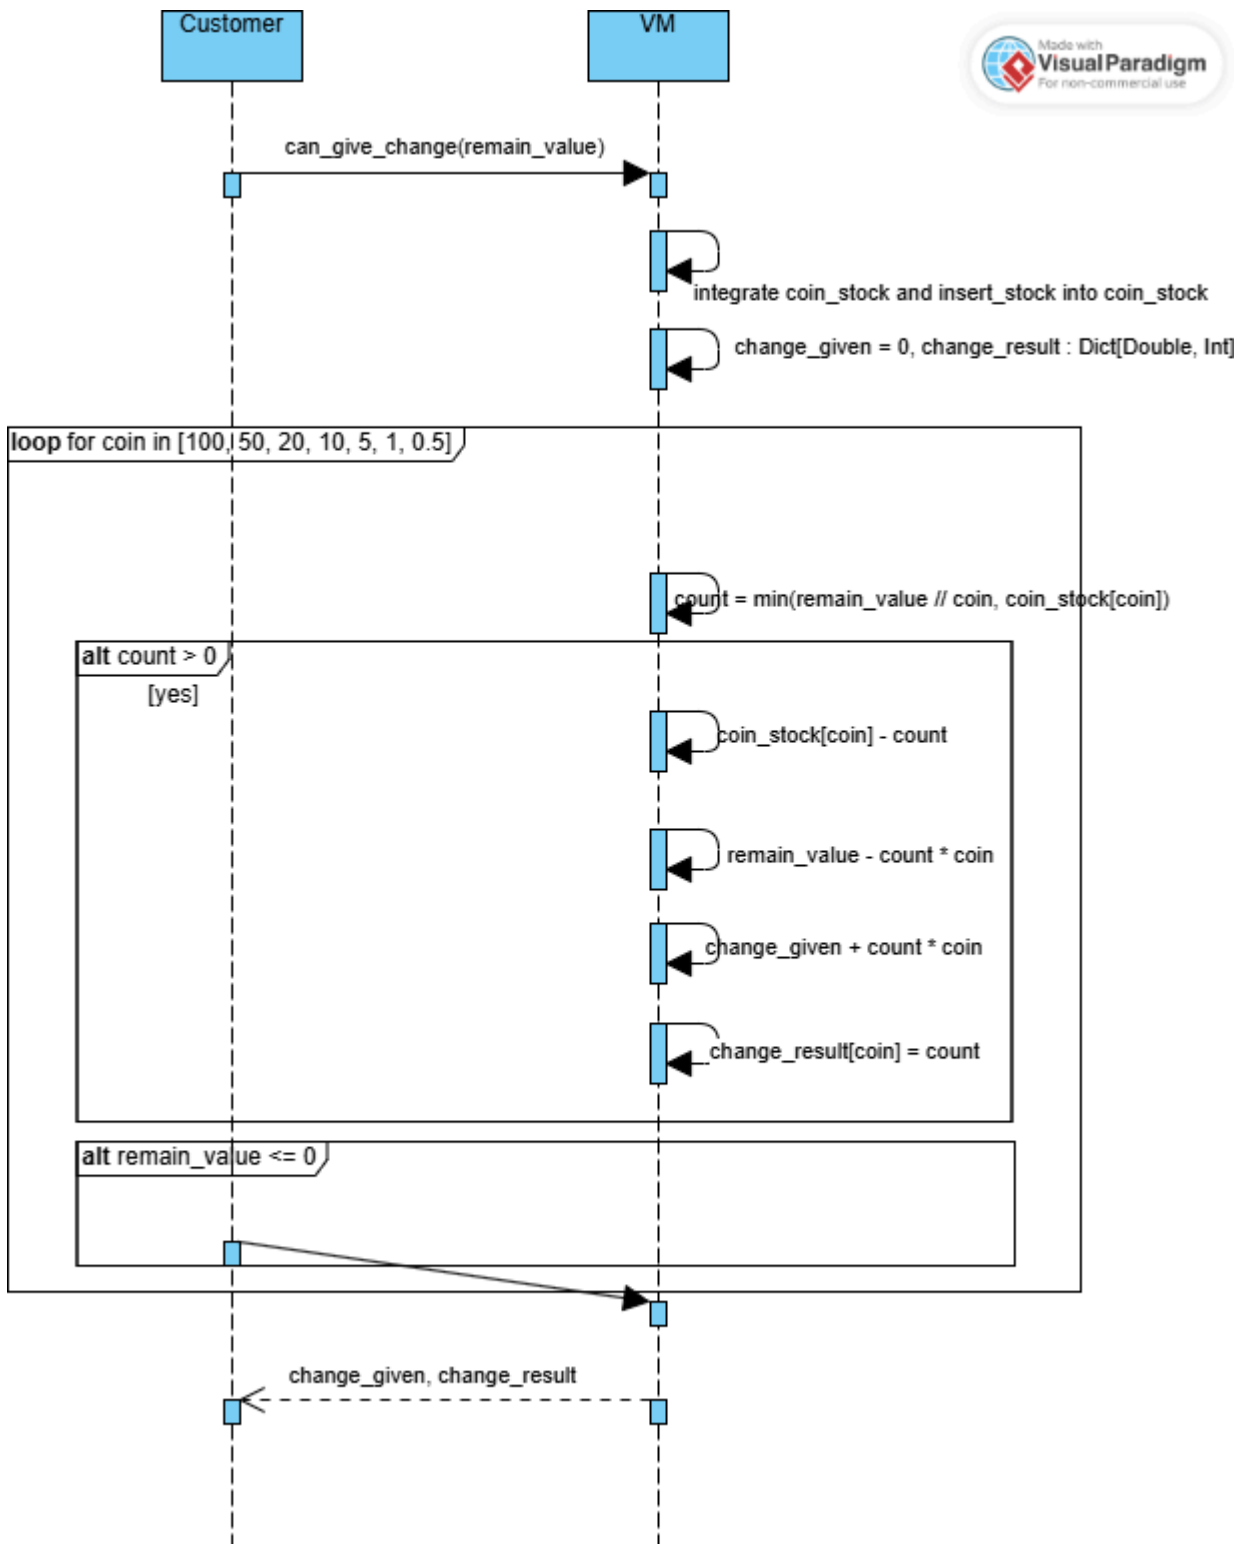

If `remain_value` is not greater than 0.05, the solution of change is found

## 1.8 give\_change

This function carries out the same way of `can_give_change` for finding the solution. However, it provide specific solution with greedy algorithm.

## 1.9 verify\_admin

The logic is very simple

- If input password correct, return true.
- otherwise, return false.

## 1.10 restock\_product

- Check if the product is in the list

If not, return failure

- set the number of corresponding product to 20

## 1.11 refill\_coin

- Check if coin is valid

If so:

- Check if the number of the money is less than threshold

If so, refill them to threshold number.

otherwise, return refill failure.

- update alert and return refill success

## 1.12 withdraw\_coin

- The opposite logic against 1.11 refill\_coin
- The money will only be withdrawn when the number of it is greater than the threshold.

# 2. UI system

---

## 2.1 setup\_user\_UI

Customer UI initialization.

## 2.2 setup\_admin\_UI

Administrator UI panel initialization.

Notice that it's set to be invisible initially.

## 2.3 update\_display

Update the text and panel state every movement, ensuring all the labels correct.

## 2.4 login

Set log-in state, set admin panel visible, set password entry disabled and set login button disabled.

## 2.5 logout

Set log-out state, set admin panel invisible, set password entry enabled and set login button enabled.
